FBI FLASH

FEDERAL BUREAU OF INVESTIGATION, CYBER DIVISION

27 May 2021

Alert Number

MI-000148-MW

The following information is being provided by the FBI, with no guarantees or warranties, for potential use at the sole discretion of recipients in order to protect against cyber threats. This data is provided to help cyber security professionals and system administrators guard against the persistent malicious actions of cyber actors. This FLASH was coordinated with DHS/CISA.

This FLASH has been released **TLP:WHITE**: Subject to standard copyright rules, **TLP:WHITE** information may be distributed without restriction.

APT Actors Exploiting Fortinet Vulnerabilities to Gain Access for Malicious Activity

Summary

The FBI is continuing to warn about Advanced Persistent Threat (APT) actors exploiting Fortinet vulnerabilities. As of at least May 2021, an APT actor group almost certainly exploited a Fortigate appliance to access a webserver hosting the domain for a U.S. municipal government. The APT actors likely created an account with the username "elie" to further enable malicious activity on the network.

The FBI and the Cybersecurity and Infrastructure Security Agency (CISA) previously warned in April 2021 that APT actors had gained access to devices on ports 4443, 8443, and 10443 for Fortinet FortiOS [CVE-2018-13379](#), and enumerated devices for FortiOS [CVE-2020-12812](#) and FortiOS [CVE-2019-5591](#).

Access gained by the APT actors can be leveraged to conduct data exfiltration, data encryption, or other malicious activity. The APT actors are actively targeting a broad range of victims across multiple sectors, indicating the activity is focused on exploiting vulnerabilities rather than targeted at specific sectors. Please see Joint Cybersecurity Advisory AA21-092A, published 2 April 2021, for more information on this activity.

Technical Details

The FBI identified the following indicators of compromise (IOCs) that we assess are likely associated with this APT activity.

New User Accounts

The APT actors may have established new user accounts on domain controllers, servers, workstations, and the active directories. Some of these accounts appear to have been created to look similar to other existing accounts on the network, so specific account names may vary per organization. In addition to unrecognized user accounts or accounts established to masquerade as existing accounts, the following account usernames may be associated with this activity:

- “elie”
- “WADGUtilityAccount”

Executable Files

| | |
|---------------|--|
| Filename: | Audio.exe or frpc.exe |
| MD5: | b90f05b5e705e0b0cb47f51b985f84db |

Associated Tools

- Mimikatz (credential theft)
- MinerGate (crypto mining)
- WinPEAS (privilege escalation)
- SharpWMI (Windows Management Instrumentation)
- BitLocker activation when not anticipated (data encryption)
- WinRAR where not expected (archiving)
- FileZilla where not expected (file transfer)

Outbound Traffic

Any FTP transfers over port 443

Unrecognized Scheduled Tasks

The APT actors may have made modifications to the Task Scheduler that may display as unrecognized scheduled tasks or "actions." Specifically, the below established task may be associated with this activity:

- SynchronizeTimeZone

Recommended Mitigations

- Immediately patch CVEs 2018-13379, 2020-12812, and 2019-5591.
- If FortiOS is not used by your organization, add the key artifact files used by FortiOS to your organization's execution denylist. Any attempts to install or run this program and its associated files should be prevented.
- Review domain controllers, servers, workstations, and active directories for new or unrecognized user accounts.
- Review Task Scheduler for unrecognized scheduled tasks. Additionally, manually review operating system defined or recognized scheduled tasks for unrecognized "actions" (for example: review the steps each scheduled task is expected to perform).
- Review antivirus logs for indications they were unexpectedly turned off.
- Regularly back up data, air gap, and password protect backup copies offline. Ensure copies of critical data are not accessible for modification or deletion from the system where the data resides.
- Implement network segmentation.
- Require administrator credentials to install software.
- Implement a recovery plan to maintain and retain multiple copies of sensitive or proprietary data and servers in a physically separate, segmented, secure location (e.g., hard drive, storage device, the cloud).
- Install updates/patch operating systems, software, and firmware as soon as updates/patches are released.
- Use multifactor authentication where possible.
- Regularly change passwords to network systems and accounts, and avoid reusing passwords for different accounts. Implement the shortest acceptable timeframe for password changes.
- Disable unused remote access/Remote Desktop Protocol (RDP) ports and monitor remote access/RDP logs.
- Audit user accounts with administrative privileges and configure access controls with least privilege in mind.
- Install and regularly update antivirus and anti-malware software on all hosts.
- Only use secure networks and avoid using public Wi-Fi networks. Consider installing and using a virtual private network (VPN).
- Consider adding an email banner to emails received from outside your organization.
- Disable hyperlinks in received emails.
